

Hyper.Net® SharePoint Edition - the universal converter for SharePoint

Overview

The Hyper.Net SharePoint Edition is a universal converter for Microsoft SharePoint. It automatically converts today's standard document formats into all of the formats your users need: HTML, PDF and other formats.

Hyper.Net automatically stores converted document content in SharePoint page libraries, making it easy to access and seamlessly integrate into any SharePoint solution using standard SharePoint components and techniques. There's nothing new to learn!

Hyper.Net automatically populates the metadata associated with every source document into all relevant areas of each document's converted content, making it easier than ever before to elegantly design and swiftly implement well-organized, personalizable content solutions with SharePoint!

In addition it provides full document lifecycle support: Hyper.Net automatically creates, updates and deletes converted content in real time as source documents are added, modified and deleted in SharePoint.

Pls. see detailed information in the brochure below.
